

## Application of Deep Learning to Text and Image Data

## Module 2, Lab 1: Processing Text

In this notebook, you will learn techniques to analyze and process text data. Text processing is known as *natural language processing* (*NLP*) and is an important topic because of how much information is communicated through text. Knowing how to handle text will help you build models that perform better and are more useful.

You will learn the following:

- What a word cloud is and how to create one
- How to use stemming and lemmatization
- What part-of-speech tagging is and how it impacts text processing
- How to use named entity recognition to sort data

You will be presented with two kinds of exercises throughout the notebook: activities and challenges.

No coding is needed for an activity. You try to understand a concept, answer questions, or run a code cell.

Challenges are where you can practice your coding skills.

## Index

- Word cloud
- Part-of-speech tagging
- Stemming and lemmatization
- · Named entity recognition

## **Initial Setup**

First let's put everything in place.

In [1]: !pip install -U -q -r requirements.txt

ERROR: pip's dependency resolver does not currently take into account all the packages that are installed. This behaviour is the source of the following dependency conflicts. autovizwidget 0.21.0 requires pandas<2.0.0,>=0.20.1, but you have pandas 2.0.3 which is incompatible. hdijupyterutils 0.21.0 requires pandas<2.0.0,>=0.17.1, but you have pandas 2.0.3 which is incompatible. sparkmagic 0.21.0 requires pandas<2.0.0,>=0.17.1, but you have pandas 2.0.3 which is incompatible.

Install the spaCy library. This will be used to perform some NLP tasks in the lab.

In [2]: !python -m spacy download en\_core\_web\_sm

```

Installing collected packages: en-core-web-sm
Successfully installed en-core-web-sm-3.7.1
✓ Download and installation successful
You can now load the package via spacy.load('en core web sm')
```

In [3]: # Import the dependencies
 from wordcloud import WordCloud, STOPWORDS
 import matplotlib.pyplot as plt
 import re, string
 import Stemmer
 import spacy
 from spacy import displacy

```
import pandas as pd
Matplotlib is building the font cache; this may take a moment.
/home/ec2-user/anaconda3/envs/pytorch p310/lib/python3.10/site-packages/torch/cuda/ init .py:551: UserWarning
: Can't initialize NVML
 warnings.warn("Can't initialize NVML")
```

Next, you need to create a function to preprocess text so that only real words, not special characters and numbers, are displayed.

```
In [4]: # Preprocess text
         def preProcessText(text):
             # Lowercase and strip leading and trailing white space
             text = text.lower().strip()
             # Remove HTML tags
             text = re.compile("<.*?>").sub("", text)
             # Remove punctuation
             text = re.compile("[%s]" % re.escape(string.punctuation)).sub(" ", text)
             # Remove extra white space
text = re.sub("\s+", " ", text)
             # Remove numbers
             text = re.sub(r"[0-9]", "", text)
             return text
```

#### Word cloud

Word clouds, which are also known as text clouds or tag clouds, help you visualize text data by highlighting the important words or phrases. Word clouds convey crucial information at a glance by making commonly occurring words bigger and bolder. These clouds are commonly used to compare and contrast two pieces of text. Word clouds are also used to identify the topic of a document.

To create a word cloud, you will use WordCloud for Python.

The following text is from the What Is Natural Language Processing (NLP)? page on aws.amazon.com.

```
In [5]: text = "Natural language processing (NLP) is a machine learning technology that gives computers the \
        ability to interpret, manipulate, and comprehend human language. Organizations today have large volumes \
        of voice and text data from various communication channels like emails, text messages, social media \
        newsfeeds, video, audio, and more. They use NLP software to automatically process this data, analyze \
        the intent or sentiment in the message, and respond in real time to human communication. \setminus
        Natural language processing (NLP) is critical to fully and efficiently analyze text and speech data. \
        It can work through the differences in dialects, slang, and grammatical irregularities typical in \
        day-to-day conversations. \
        Companies use it for several automated tasks, such as to: \
        Process, analyze, and archive large documents
        Analyze customer feedback or call center recordings
        Run chatbots for automated customer service
        Answer who-what-when-where questions
        Classify and extract text \
        You can also integrate NLP in customer-facing applications to communicate more effectively with \
        customers. For example, a chatbot analyzes and sorts customer queries, responding automatically to \ common questions and redirecting complex queries to customer support. This automation helps reduce \
        costs, saves agents from spending time on redundant queries, and improves customer satisfaction.
In [6]:
        # Remove stop words before generating the word cloud
        wordcloud = WordCloud(stopwords=STOPWORDS, background color="black", max words=300)
        # Clean up the text to prevent plotting punctuation and duplicate words (for example, 'Natural' and 'natural')
```

```
wordcloud.generate(preProcessText(text))
plt.figure(figsize=(15, 10))
plt.axis("off")
plt.imshow(wordcloud);
```

Now that you have created a word cloud, do you see how it can help you quickly identify key words?

Note that the stop words were removed before the graphic was created. This is important so that words that don't impact the meaning of the text aren't overemphasized. Can you think of some examples of stop words?

In this example, you used the precompiled list of stop words that were curated by the WordCloud for Python project. You can print a list of the stop words to make sure that they cover the stop words that you expect.

```
In [7]: # Show the list of stop words
", ".join(list(STOPWORDS))
```

"couldn't, it, however, until, out, be, over, more, no, i'll, weren't, with, like, nor, they, you, also, not, s he'll, what, yourselves, they're, i'd, else, which, or, that, when, would, our, they've, most, who, wouldn't, j ust, once, above, isn't, she's, having, after, www, here's, http, ever, ought, when's, before, herself, let's, there, are, ourselves, i've, com, how's, shall, against, by, for, itself, didn't, how, r, on, where's, theirs, get, can't, is, does, why's, hasn't, too, during, few, his, you're, have, very, its, had, could, their, down, a ny, from, we've, as, where, of, your, them, did, only, therefore, if, we, own, because, i'm, other, they'd, can, such, you'll, this, ours, you'd, been, he'd, at, was, further, do, that's, yours, we're, to, the, they'll, ab out, he'll, both, and, don't, my, won't, myself, she, me, mustn't, being, hers, otherwise, shan't, am, there's, here, she'd, whom, shouldn't, doing, why, each, so, below, but, you've, what's, same, since, who's, cannot, tho se, into, all, off, some, we'd, we'll, himself, then, it's, hence, in, between, he, a, an, aren't, wasn't, unde r, hadn't, k, doesn't, than, through, up, him, were, should, i, haven't, he's, her, again, has, while, themselv es, these, yourself"

## Part-of-speech tagging

The process of classifying words into their corresponding part of speech based on definition and context is called *part-of-speech tagging*, which is also known as *POS tagging*. A part-of-speech tagger processes a sequence of words and attaches a part-of-speech tag to each word.

For this lab, you will use the Natural Language Toolkit spaCy. The nlp() function creates different token attributes, among them the one representing the token tag: token.pos. For example, the following tagged token combines the word fly with a noun part of speech tag, NN: tagged tok = ('fly', 'NOUN').

The following table provides the meanings for the tags from a lst of Universal POS tags:

Tag	Meaning
ADJ	Adjective
ADV	Adposition
ADP	Adverb
AUX	Auxiliary
CCONJ	Coordinating Conjuction
DET	Determiner
INTJ	Interjection
NOUN	Noun
NUM	Numeral
PART	Particle

PRON Pronoun PROPN Proper Noun PUNCT Punctuation SCONJ **Subordinating Conjuction** SYM Symbol **VERB** Verb Χ Other

Now you can use the tagger to tag each token or word in the following text.

Important: Always remember to preprocess the text before tagging, as we have done before in this notebook.

```
In [8]: # Text sample
        text
```

'Natural language processing (NLP) is a machine learning technology that gives computers the ability to interpr Out[8]: et, manipulate, and comprehend human language. Organizations today have large volumes of voice and text data fr om various communication channels like emails, text messages, social media newsfeeds, video, audio, and more. T hey use NLP software to automatically process this data, analyze the intent or sentiment in the message, and re spond in real time to human communication. Natural language processing (NLP) is critical to fully and efficient ly analyze text and speech data. It can work through the differences in dialects, slang, and grammatical irregu larities typical in day-to-day conversations. Companies use it for several automated tasks, such as to: Pro cess, analyze, and archive large documents large customer feedback or call center recordings i>Run chatbots for automated customer service Answer who-what-when-where questions Classify a nd extract text You can also integrate NLP in customer-facing applications to communicate more effectively with customers. For example, a chatbot analyzes and sorts customer queries, responding automatically to common questions and redirecting complex queries to customer support. This automation helps reduce costs, saves agents from spending time on redundant queries, and improves customer satisfaction.

## Try it yourself!

To use the spaCy part-of-speech tagger, run the following cell.

Observe the tags that are assigned to each word, and use the table from a previous cell to understand the meaning of each tag.

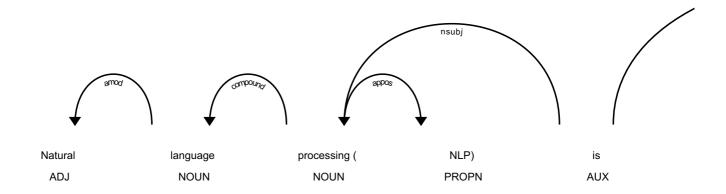

```
In [9]:
        # Part-of-speech tagging
        nlp = spacy.load("en core web sm")
        doc = nlp(text)
        token_text = [token.orth_ for token in doc]
        token lemma = [token.lemma for token in doc]
        token pos = [token.pos for token in doc]
        pd.DataFrame(zip(token_text, token_pos),
                     columns=['token text', 'token lemma'])
```

#### token\_text token\_lemma Out[9]:

	_	_
0	Natural	ADJ
1	language	NOUN
2	processing	NOUN
3	(	PUNCT
4	NLP	PROPN
248	and	CCONJ
249	improves	VERB
250	customer	NOUN
251	satisfaction	NOUN
252		PUNCT

253 rows × 2 columns

Refer to the table in a previous cell to identify the tags that the spaCy tagger produces.

## Stemming and lemmatization

Stemming and lemmatization are two ways to process words so that a model will be more efficient. Both methods remove parts of words so that they can be grouped together.

For example, in the following sentence, "ning" would be removed from "running" so that "running" and "run" would be categorized the same.

What could make stemming and lemmatization difficult to do properly?

# Try it yourself! Activity In the next few sections, you will compare stemming and lemmatization. Consider which text processing method is more suitable for the use case that is provided.

#### Stemming

Stemming is a rule-based system to convert words into their root forms by removing suffixes. This method helps to enhance similarities (if any) between sentences. Examples: "jumping", "jumped" -> "jump" "cars" -> "car" In [11]: # let's list the language available print(Stemmer.algorithms()) ['arabic', 'armenian', 'basque', 'catalan', 'danish', 'dutch', 'english', 'finnish', 'french', 'german', 'greek ', 'hindi', 'hungarian', 'indonesian', 'irish', 'italian', 'lithuanian', 'nepali', 'norwegian', 'porter', 'port uguese', 'romanian', 'russian', 'serbian', 'spanish', 'swedish', 'tamil', 'turkish', 'yiddish'] In [12]: # we will use english for this example stemmer = Stemmer('english') print(original\_text) In [14]: # Cleaned text cleaned text = preProcessText(original text) print(cleaned text)

this is a message to be cleaned it may involve some things like adjacent spaces and tabs

```
# Use a tokenizer (nlp) and stemmer from the PyStemmer library
nlp = spacy.load("en_core_web_sm")
In [15]:
          doc = nlp(original_text)
          stemmed_sentence = []
          original_sentence = []
          # Tokenize the sentence
          for token in doc:
              original_sentence.append(token.text)
               stemmed_sentence.append(stemmer.stemWord(token.text))
          pd.DataFrame(zip(original_sentence, stemmed_sentence),
                         columns=['token_text', 'token_stemmer'])
```

	token_text	token_stemmer
0		
1	This	This
2	is	is
3	а	а
4	message	messag
5	to	to
6	be	be
7	cleaned	clean
8		
9	It	It
10	may	may
11	involve	involv
12	some	some
13	things	thing
14	like	like
15	:	:
16	<	<
17	br	br
18	>	>
19	,	,
20	?	?
21	,	,
22	:	:
23	,	,
24	"	"
25		
26	adjacent	adjac
27	spaces	space
28	and	and
29	tabs	tab
30		
31		

Out[15]:

```
In [16]: stemmed_text = " ".join(stemmed_sentence)
print(stemmed_text)
```

This is a messag to be clean . It may involv some thing like : < br > , ? , : , '' adjac space and tab

From the output of the previous code cell, you can see that stemming isn't perfect. It makes mistakes, such as "messag", "involv", and "adjac". Stemming is a rule-based method that sometimes mistakenly removes suffixes from words. It does run quickly, which makes it appealing to use for massive datasets.

#### Lemmatization

32

If you aren't satisfied with the result of stemming, you can use the lemmatization instead. This method usually requires more work but gives better results.

Lemmatization needs to know the correct word position tags, such as "noun", "verb", or "adjective". You need to use another spaCy function to feed this information to the lemmatizer.

The cell below uses part of the full list of position tags listed in the previous session Part-of-speech tagging.

	token_text	token_lemma

Out[17]:

```
In [18]: lemmatized_text = " ".join(token_lemma)
print(lemmatized_text)
```

this be a message to be clean . it may involve some thing like : < br > , ? , : , '' adjacent space and t ab .

How do the results compare? Is the lemmatized text better than the stemmed text?

## Named entity recognition

Named entity recognition involves identification of key information in text and then classifying that information into predefined categories, such as person, organization, place, or date. This is one of the most popular NLP tasks.

For this section, you will use spaCy. The following table lists the categories and meanings of the category labels that the spaCy module uses.

Category	Meaning
CARDINAL	Numerals that don't fall under another type
DATE	Absolute or relative dates or periods
EVENT	Named hurricanes, battles, wars, sports events, and so on
FAC	Buildings, airports, highways, bridges, and so on
GPE	Countries, cities, states
LANGUAGE	Any named language

LAW	Named documents made into laws
LOC	Non-GPE locations, mountain ranges, bodies of water
MONEY	Monetary values, including unit
NORP	Nationalities, or religious or political groups
ORDINAL	"first", "second", and so on
ORG	Companies, agencies, institutions, and so on
PERCENT	Percentage, including "%"
PERSON	People, including fictional
PRODUCT	Objects, vehicles, foods, and so on (not services)
QUANTITY	Measurements, as of weight or distance
WORK_OF_ART	Titles of books, songs, and so on

The following text was retrieved from the Amazon - The Climate Pledge page of the About Amazon website.

```
In [19]: # Sample text for named entity recognition
    ner_text = "Amazon and Global Optimism co-founded The Climate Pledge, \
    a commitment to net-zero \
    carbon by 2040."

In [20]: # Load the spaCy English pipeline for named entity recognition
    NER = spacy.load("en_core_web_sm")

# Tag entities in the text
    for word in NER(ner_text).ents:
        print(word.text, word.label_)

Amazon ORG
    Global Optimism ORG
    The Climate Pledge WORK_OF_ART
    2040 DATE
```

## Visualizing the Tags

spaCy has a visualizer called displaCy that you can use to visualize tags. Run the following cell to see it working.

```
In [21]: # Visual tag with text displacy.render(NER(ner_text), style="ent", jupyter=True)

Amazon org and Global Optimism org co-founded The Climate Pledge work_of_art, a commitment to net-zero carbon by 2040 date.
```

As you can see, named entity recognition can help you identify different entities in text. The process isn't always correct, but it can process large sections of text faster than a human can.

#### Conclusion

In this lab, you practiced using text processing techniques.

### Next lab

In the next lab, you will learn about the bag-of-words (BoW) method to convert text data into numerical values.
